REF:24/01944/PRI033

The proposed structure is a PVC fabric sheet covering a narrow circular section aluminium frame. The frame is simply laid on to the ground, in this case the grassed area of the existing beer garden. Once the cover has been pulled over the frame it is then held down with proprietary steel pegs driven in to the ground. When the marquee is to be removed it is just a case of reversing the method in which is has been erected. If it is found that the grass that had been covered by the marquee has died back and become patchy, this damaged can be easily restored with spreading new grass seed to the affected areas.
